

Announcing New Amgen Global Phase 2 MDS Study

Amgen. Protocol 20060198: Phase 2, multicenter, randomized, double blind, placebo controlled study designed to assess the efficacy and safety of romiplostim (formerly, AMG 531) treatment in thrombocytopenic MDS subjects. The study is composed of a 26-week placebo controlled test treatment period (romiplostim versus Placebo), a 2 to 4 week interim wash-out period, a 24-week placebo controlled extended treatment period, and a 4-week follow-up period. During the interim wash-out period, a bone marrow biopsy will be performed in the absence of growth factor to assess changes in the marrow. In the extended treatment period, safety assessments will continue and subjects will be allowed to receive any standard of care treatments for MDS. Contact the Amgen Call Center at 866-572-6436.

Amgen sponsored study being conducted at the following centers currently:

United States, Alabama
